LLM Response:
At its simplest, **Artificial Intelligence (AI)** is **making computers think and learn like humans.**

Normally, a computer only does exactly what a human tells it to do. But with AI, we give computers the ability to figure things out, solve problems, and make
decisions on their own.

Here is an easy way to understand it:

### 1. Regular Computer vs. AI
* **Regular Computer:** If you program it with a recipe, it can bake a cake. But if you ask it to bake something without a recipe, it can't do it.
* **AI Computer:** You show it thousands of pictures of cakes, and it figures out *how* to bake a cake on its own. It learns from experience.

### 2. How does it work?
AI learns the same way humans do: **through practice and data.**
If you want to teach an AI to recognize a cat, you show it millions of pictures of cats. After a while, the AI notices patterns (whiskers, pointy ears, fur) a
nd starts recognizing cats all by itself.

### 3. Examples of AI you probably use every day:
* **Recommendation systems:** When Netflix or YouTube suggests a movie or video you might like, that's AI guessing your taste.
* **Voice assistants:** Siri and Alexa use AI to understand your spoken words and answer your questions.
* **GPS Navigation:** Google Maps or Waze uses AI to figure out the fastest route and avoid traffic jams in real-time.
* **Spell check:** When your phone predicts the next word you are going to type, that is AI.

### Summary
AI isn't a robot with feelings. It's just **very smart software** that can look at information, learn from it, and make decisions faster than we can.
